

Live Portfolio

<https://yuguda999.github.io/ys-dev/>

All sitemap pages reachable: Home, FL-04, CampusPQ, Edix. Nav works both directions on every page.

Reviewer: Fuhad, Backend Dev

Sent the live URL, asked for an honest read on FL-04 and Edix. Reaction:

FL-04 — landed well. Called it one of the stronger case studies in this format: clean structure (problem → current state → planned upgrade → tech stack), and specifically praised being upfront that it's a workflow, not an agent yet ("most people writing about AI agents blur this"). Said the vLLM log screenshot grounds the claim instead of just prose, and that labeling the orchestrator as "designed, not built" reads as more credible than overclaiming. Two gaps flagged: the page didn't say what decides minor-vs-major change routing, and "ADR" was used before being spelled out.

Edix — problem and architecture read as coherent, but thinner than FL-04. Said "anchored to the ledger" didn't specify what gets anchored (a technical reviewer can't tell if it's well-designed or blockchain-as-decoration without that), no reason given for choosing Cardano specifically, and the page was missing a "current state" line so it read as more finished than FL-04 even though status wasn't stated. Also noted the wallet screenshot proves the integration works but doesn't show the actual certificate-verification flow, which is the stronger proof point.

Nothing broken — links, images, nav all resolved on his end.

All four gaps he named have since been fixed and pushed live: ADR defined on first use, diff-size threshold named for the routing decision, Edix now states current state (deployed, preprod/testnet not mainnet), names the anchoring mechanism (hash per certificate), and gives the reason for choosing Cardano (transaction cost).

Still Ugly

- Edix: screenshot shows the wallet/balance screen, not the actual certificate-verification flow — the stronger proof point for the project's core claim isn't captured yet.
- FL-04: the orchestrator's minor/major routing is a designed diff-size threshold, not shipped code — the live pipeline is still the fixed three-step workflow.
- No mobile breakpoints tested.
- One screenshot per case, no architecture diagrams.
- No links from case pages to the actual project repos/code.
- Plain CSS, no design system — functional, not polished.
