

Explain It Like You Built It — Stale-Branch Double-Count Bug

The piece: the branch-staleness check in `weekly-review-collect.sh`, part of the weekly repo review agent (Checkpoint 1 build).

My weekly-review script checks git branches for staleness. It found that the exact same stale work was being reported twice. Turns out `main` and `origin/main` are just two different labels for the same thing — `main` is the label pointing at my last commit here, and `origin/main` is just a cached bookmark of what that same branch looked like on the server last time I synced. Normally the script just checks those names one by one, so it doesn't realize they're pointing to the exact same snapshot of code. I fixed it by having the script look up the unique ID (the commit hash) behind each name first. Now it keeps a running list of IDs it has already checked, and if it sees a duplicate ID under a new name, it skips it.
